

The Theory Of Lie Superalgebras An Introduction

As recognized, adventure as skillfully as experience practically lesson, amusement, as well as union can be gotten by just checking out a books **the theory of lie superalgebras an introduction** plus it is not directly done, you could agree to even more approaching this life, with reference to the world.

We manage to pay for you this proper as competently as simple pretension to get those all. We present the theory of lie superalgebras an introduction and numerous ebook collections from fictions to scientific research in any way. among them is this the theory of lie superalgebras an introduction that can be your partner.

In mathematics, a Lie superalgebra is a generalisation of a Lie algebra to include a \mathbb{Z}_2 -grading. Lie superalgebras are important in theoretical physics where they are used to describe the mathematics of supersymmetry. In most of these theories, the even elements of the superalgebra correspond to bosons and odd elements to fermions.

~~Some basic results of the theory of Yangians of Lie superalgebras are described. Yangian of basic Lie superalgebra is described as a result of quantization of Lie superbialgebra of polynomial loops. Also, we consider a quantization of Lie superalgebra of twisted currents. Two systems of generators and defining relations are introduced.~~

The 13 of the simple stringy Lie superalgebras are distinguished: only they have nontrivial central extensions; since two of the distinguish algebras have 3 nontrivial central extensions each, there are exactly 16 superizations of the Liouville action, Schroedinger equation, KdV hierarchy, etc.

In the theory of Lie superalgebras $l(V) = I(V) \oplus l(V)_i$ plays the same role as the general linear Lie algebra in the theory of Lie algebras. If we regard the same decomposition $V = V_0 \oplus V_1$ as a \mathbb{Z} -grading of V , then it corresponds to a \mathbb{Z} -grading of $I(V)$, which is compatible with the \mathbb{Z} -grading: $l(V) = \bigoplus_{i \in \mathbb{Z}} l(V)_i$.

Abstract: For classical Lie superalgebras of type I, we provide necessary and sufficient conditions for a Verma supermodule $\Delta(\lambda)$ to be such that every non-zero homomorphism from another Verma supermodule to $\Delta(\lambda)$ is injective. This is applied to describe the socle of the cokernel of an inclusion of Verma supermodules over the periplectic Lie superalgebras $\mathfrak{pe}(n)$ and, furthermore, to reduce the problem of description of $\mathrm{Ext}^1_{\mathcal{O}}(L(\mu), L(\nu))$.

We initiate the representation theory of restricted Lie superalgebras over an algebraically closed field of characteristic $p > 2$. A superalgebra generalization of the celebrated Kac-Weisfeiler conjecture is formulated, which exhibits a mixture of p -power and 2 -power divisibilities of dimensions of modules. We establish the conjecture for basic classical Lie superalgebras.

In the geometric representation theory of Lie algebras, the Borel-Weil-Bott (BWB) theorem (see Theorem 2.7) plays a crucial role. This theorem describes how to construct families of representations from sheaf cohomology groups associated to certain vector bundles. It was shown by I. Penkov, that this theorem is not true for Lie superalgebras.

Lie superalgebras are generalizations of Lie algebras, useful for depicting supersymmetry - the symmetry relating fermions and bosons. Most known examples of Lie superalgebras with a related automorphic form such as the Fake Monster Lie algebra whose reflection group is given by the Leech lattice arise from (super)string theory and can be derived from lattice vertex algebras.

For the case of Lie algebras, where the situation is more complicated than commutative or associative algebras, the parallel theory of Grobner basis was developed by Shirshov in 1962, which is even earlier than Buchberger's discovery.
